Open application · Junior software / backend / applied AI

Dear Hiring Team,

I am looking for my first professional opportunity in software, backend development or applied AI. My route into the field is not traditional: I began in business studies and learned software by turning real ideas into small, testable projects. That route has made me comfortable admitting what I do not know, asking precise questions and improving from evidence.

AI coding assistants are an important part of how I work, and I do not hide that. I define the objective and constraints, direct the work, inspect the resulting code, run the product, reproduce failures and keep limits visible. I am still strengthening my independent coding and computer-science foundations, but I can already help turn an unclear brief into a reviewable working path.

My public projects show that process. API Contract Guard is a deliberately bounded TypeScript tool backed by 102 local tests. EvidenceDesk links answers to supporting passages and also publishes the evaluation that did not pass. PostgreSQL Migration Rehearsal lets me practise migrations, rollback and integrity checks locally on synthetic data. These are learning projects, not substitutes for professional experience, but they show how I approach responsibility and verification.

I have been admitted to OPIT's online BSc (Hons) in Computer Science for the September 2026 intake; enrolment is still pending. I plan to study alongside full-time work so that formal foundations and practical experience can grow together. I would value a team where code review is normal, expectations are clear and a junior is trusted to learn while contributing.

If that matches how your team works, I would be glad to discuss a real problem, complete a fair practical assessment and explain exactly how I reached my answer.

Thank you for your time,

Ardian Mehaj
