Open application · Junior software / backend / applied AI

Dear Hiring Team,

I am looking for my first role in software development or applied AI. I started in business studies, then became interested in building software through my own projects. I would like to take that work further in a team where I can learn from experienced developers.

I understand code, but I do not yet write it independently. I use Claude, Cursor, ChatGPT and Codex to work through scoped implementation tasks, then run the result and test its behaviour. I have used Claude for around 18 months and keep improving my coding fundamentals alongside my use of AI.

My portfolio includes API Contract Guard, a TypeScript tool with 102 recorded local tests, and EvidenceDesk, a document-review prototype with source citations. EvidenceDesk also has an answer evaluation that did not pass, which is documented in the repository. Synthevia has a public project page and a separate local React, FastAPI and SQLite sample using fictional data. The portfolio also presents five public project demos. These personal projects give us something concrete to discuss.

I am available for full-time work and have been admitted to OPIT's online BSc (Hons) Computer Science, September 2026 intake. Classes begin on 21 September, and I plan to study alongside work. I would value clear expectations, regular code review and the chance to contribute while learning.

I would be glad to walk you through one of my projects, explain how I built it and discuss whether my current level fits what your team needs.

Thank you for your time,

Ardian Mehaj
