

Open application · Junior software / backend / applied AI

Dear Hiring Team,

I am looking for my first role in software development or applied AI. I started in business studies, then became interested in building software through my own projects. I would like to take that work further in a team where I can learn from experienced developers.

I understand code, but I still need AI assistance to write it. I describe what I want to build, work through the implementation with coding assistants and check the result by running it and testing its behaviour. I am getting better at using these tools and working on my coding fundamentals at the same time.

My portfolio includes API Contract Guard, a TypeScript tool with 102 recorded local tests, and EvidenceDesk, a document-review prototype with source citations. EvidenceDesk also has an answer evaluation that did not pass, which is documented in the repository. Synthevia shows a smaller React and FastAPI workspace using fictional data. These personal projects give us something concrete to discuss.

I am available for full-time work and plan to study computer science online alongside it. The institution is not yet finalised. I would value clear expectations, regular code review and the chance to contribute while learning.

I would be glad to walk you through one of my projects, explain how I built it and discuss whether my current level fits what your team needs.

Thank you for your time,

Ardian Mehaj
